

Discovering the Treasure Map

For my 2nd interview, I had the opportunity to talk to an alumni from the University of Pennsylvania specifically their M&T Program which allows students to pursue both a degree in their school of Engineering and the Wharton school of business. I was interested in learning more about his experience in both Business and Technology as it was the niche I want to move into later on in my career. The interview was really helpful in learning more about this unique program at the University of Pennsylvania but also the utility of a business education in the technical field. I will use these insights not only to plan out my own education during college and later but also to dive deeper into the world of business and learn more about management and planning. He explained that he knows how to think like a CEO even though he is only an engineer right now and he believes he will be able to make his way into management very quickly with this edge. It was also interesting to hear about Mr. Rogers job as an Engineer at Relativity Space which is a company that builds rockets utilizing 3D printing. Mr. Rogers unique perspective on his preparation for his career and how business has played into that provided me with very useful knowledge for preparing my own future.
