Brainstorming

Now that the annotated bibliography #1 is behind us. I have focused my attention on trying to hone in on my area of work. I focused my research in the annotated bibliography on various fields of Computer Science such as VR, AR, Data Visualization, and AI. I hope to continue researching these subfields in order to help myself find inspiration for what I want to do for my ISM project while also making sure that my project is impactful. I hope to also start searching for a mentor within the fields I am interested in by beginning the process of arranging interviews with professionals. I hope to talk to experts in a variety of fields in order to further help educate my decision on what field I want to make my project. Once, I figure out what field I will work in and have interviewed a couple of people, I will begin to start asking for their mentorship in order to begin my project. I am currently hoping to go down 2 paths with my ISM work. The first path would be to work with a researcher to conduct research on a unique topic and eventually display my research to the world. The second path would consist of me making an application to solve a problem using these innovative technologies and releasing the app to the world. I hope that I can quickly find what I want to do in ISM for the rest of the year and start working on building something great!
